Preface	ix
Authors	xi
Abbreviations	xv
1 Auxin signal transduction	1
<i>Gretchen Hagen</i>	
Abstract.....	1
Introduction.....	1
Major molecular components involved in auxin signalling.....	3
Current models of auxin signalling.....	6
Research in progress on auxin signalling.....	7
Developing areas of research on auxin signalling.....	8
Future challenges.....	9
Summary.....	10
References.....	10
2 Plant cytokinin signalling	13
<i>Erika A. Keshishian and Aaron M. Rashotte</i>	
Abstract.....	13
Introduction.....	13
The structures and activities of cytokinins.....	14
Cytokinin signalling: multistep phosphorelay.....	16
The receptors: histidine kinases.....	17
Relaying the signal: histidine phosphotransfer proteins.....	18
Response regulators.....	19
Type-B response regulators.....	20
Type-A response regulators.....	22
Cytokinin-response factors.....	22
Conclusion.....	23
Three immediate future goals and directions for cytokinin research.....	23
Summary.....	24
References.....	25
3 Abscisic acid: biosynthesis, inactivation, homoeostasis and signalling	29
<i>Ting Dong, Youngmin Park and Inhwan Hwang</i>	
Abstract.....	29
Introduction.....	30
Physiological roles of ABA in plants.....	30

ABA biosynthesis and catabolism.....	31
Long-distance ABA transport.....	34
Regulation of ABA homoeostasis.....	36
ABA perception and initiation of ABA signalling	36
Conclusions and future perspectives.....	41
Summary	42
References	42

4 GA signalling and cross-talk with other signalling pathways49

Vai S. Lor and Neil E. Olszewski

Abstract.....	49
Introduction	49
GA signalling involves the destruction of proteins that repress GA responses	50
DELLA proteins are co-activators of transcription	52
Mutant DELLA proteins underlie the ‘Green Revolution’.....	52
DELLA proteins mediate cross-talk with other signalling pathways	53
Homoeostatic regulation of GA signalling: GA signalling turns off GA signalling.....	56
What are the gaps in our knowledge of GA signalling?	56
Summary	57
References	57

5 Mechanisms of ethylene biosynthesis and response in plants61

Paul B. Larsen

Abstract.....	61
The role of ethylene in plant development	62
Ethylene biosynthesis.....	62
The canonical ethylene signalling pathway	63
The biochemical rheostat that controls the level of the ethylene response	66
Conclusion: future challenges for understanding the role of ethylene in plant biology	67
Summary	68
References	68

6 The molecular circuit of steroid signalling in plants71

Thomas Hartwig and Zhi-Yong Wang

Abstract.....	71
Introduction	71
Plant steroid signalling pathway.....	72
The network of signal cross-talk and integration	75

Summary	80
References	81

7 Novel players fine-tune plant trade-offs.....83

Selena Gimenez-Ibanez, Marta Boter and Roberto Solano

Abstract	83
Introduction	84
JA-Ile perception and the nature of the bioactive hormone.....	85
The JAZ family: a multifunctional and versatile hub of repressors.....	86
Direct targets of JAZ proteins: the array of TFs that control JA-Ile responses	88
JAZ proteins as key hubs in cross-talk with other hormone signalling cascades	92
Conclusions.....	94
Summary	95
References	96

8 Salicylic acid signalling: new insights and prospects at a quarter-century milestone101

*Xiaoyu Liu, Kristin S. Rockett, Camilla J. Kørner and
Karolina M. Pajerowska-Mukhtar*

Abstract	101
Introduction: SA as the key immune hormone in plants	102
Salicylic acid biosynthesis.....	103
SAR mobile signals	104
SA receptor(s): the stories of NPR1, NPR3 and NPR4.....	105
Novel SA-signalling components	106
SA-mediated ER stress	107
SAR-mediated transgenerational immune memory	108
Closing remarks and future directions	109

--------------------	-----

PREFACE

Plant hormones or phytohormones are small signalling molecules that function at low concentrations to regulate a wide variety of growth, developmental and environmental responses within both flowering and non-flowering plants. These signals have also been referred to as plant growth substances, although this latter terminology may be too narrow to encompass all aspects of plant hormone action. The five 'classical' plant hormones (i.e. auxins, cytokinins, gibberellins, ethylene and abscisic acid) were the first to be discovered and characterized, but today the categories of phytohormones have been expanded to include jasmonates, brassinosteroids, salicylic acid and strigolactones. Beyond these, florigen and signalling peptides have in some cases (and here) also been included in the list of plant hormones.

Historically, the bulk of investigations into plant hormone signalling have restricted the focus to a single hormone, but more recent studies have begun to consider cross-talk among the different classes of hormones and whether signalling among hormones is antagonistic or synergistic. These cross-talk studies have revealed that selected hormones rarely act in isolation, but rather co-ordinate with other hormones in signalling. In this volume of *Essays in Biochemistry*, authors discuss what is thought to be the primary functions of individual hormones, but also the host of interactions among the different classes of plant hormones.

Our understanding of the molecular mechanisms involved in plant hormone signalling has increased dramatically in the last two decades due largely to employment of facile genetic systems (e.g. generation and selection of hormone signalling mutants and availability of entire genomic sequences) and powerful molecular and cell biology tools. This has led to the assimilation of detailed hormone signal-transduction pathways, including the identification of unconventional hormone receptors, *cis*-elements in promoters that confer hormone responsiveness, transcription factors that target the *cis*-elements and confer activation or repression on the hormone response genes, and downstream gene products involved in hormone responses. Interestingly, these recent studies have uncovered similar signalling processes used by different classes of plant hormones. In some cases, these processes are unique to plants, and in other cases, they are related to bacterial signalling. Some of the information gained from these basic studies suggests future directions, including those aimed at crop improvement.

In this volume of *Essays in Biochemistry* on plant hormone signalling, Chapters 1-10 focus on individual hormones, including auxin, cytokinin, abscisic acid, gibberellins, ethylene, brassinosteroids, jasmonic acid, salicylic acid, peptides and florigen, but also discuss cross-talk with other hormones. Chapter 11 discusses seed germination as a well-studied example of hormone cross-talk. Chapter 12 addresses similarities and differences among different plant hormone pathways, and includes some preliminary information on signalling by strigolactone, the most recently discovered plant hormone. Overall, these chapters summarize current information on plant hormone signalling and address some of the questions that are under investigation.

We would like to thank all of the authors for their willingness in providing up-to-date, informative, critical and engaging chapters that target upper level undergraduates and graduate students in this field of biochemistry. We would also like to thank Professor Nigel Hooper,

Series Editor of *Essays in Biochemistry*, and the Advisory Panel for the invitation to serve as Guest Editors for the volume on Plant Hormone Signaling, and to give special thanks to Clare Curtis, Executive Editor of *Essays in Biochemistry*, for her many efforts and perseverance in recruiting authors and for keeping submissions, reviews, revisions and production of chapters on schedule.

Thomas J. Guilfoyle and Gretchen Hagen
June 2014

AUTHORS

Gretchen Hagen completed a Ph.D. in Plant Science at the University of Georgia. Following a 2-year Postdoctoral Fellowship in maize molecular biology at the University of Minnesota, she was a National Institutes of Health Postdoctoral Fellow working on plant RNA polymerases and auxin biology with Dr. Tom Guilfoyle at the University of Minnesota. She is currently a Research Professor in the Biochemistry Department at the University of Missouri, Columbia.

Erika A. Keshishian is a Graduate Student in the Department of Biological Sciences at Auburn University. She is currently investigating the role of *Arabidopsis* cytokinin response factors 1 and 2 in growth and developmental processes.

Aaron M. Rashotte is an Associate Professor in the Department of Biological Sciences at Auburn University, and has been studying hormones, including cytokinin and auxin, for more than 15 years. Current research in his laboratory is focused on understanding the functional role of the cytokinin response factors (CRFs) in growth, development, stress and cytokinin-regulated processes in both *Arabidopsis* and tomato.

Inhwan Hwang is currently working as a Professor in the Division of Integrative Biosciences and Biotechnology at Pohang University of Science and Technology, South Korea. He completed B.S. and M.S. degrees in the Chemistry Department of Seoul National University, South Korea, a Ph.D. in the Department of Biochemistry and Biophysics, University of North Carolina at Chapel Hill, U.S.A., and postdoctoral training at the Department of Molecular Biology, Massachusetts General Hospital and Genetics Department, Harvard Medical School, U.S.A. Currently he is studying the mechanisms underlying abscisic acid (ABA) homeostasis and signalling, protein trafficking and targeting, and the biogenesis and function of organelles in plants, and actively seeking to apply his findings to the development of plants as a biomaterial production platform.

Ting Dong completed a Ph.D. in Integrative Biological Engineering under the supervision of Professor Inhwan Hwang at Pohang University of Science and Technology, South Korea. Her study focused on the catabolism and homeostasis of ABA, and the role of ABA in the abiotic stress response. She had previously received an M.S. in Botany from the School of Life Science, Shandong University, China, and a B.S. majoring in Biotechnology from the School of Life Science, Shaanxi Normal University, China.

Youngmin Park is currently undertaking M.S. and Ph.D. integrated courses in the Integrative Biology and Bioengineering Department, Pohang University of Science and Technology, South Korea, under the supervision of Professor Inhwan Hwang. The aim of her research is to understand ABA homeostasis at the intracellular level by focusing on the protein trafficking that is important for its regulation, including ABA transporters. She previously received a B.S. in Life Science from Chung-Ang University, Seoul, South Korea.

Neil Olszewski is a Professor in the Department of Plant Biology at the University of Minnesota, U.S.A. His laboratory studies focus on the role of post-translational modification in gibberellin signalling in *Arabidopsis thaliana* and tomato.

Vai S. Lor is a Ph.D. student in Neil E. Olszewski's laboratory in the Plant Biological Sciences program at the University of Minnesota, U.S.A. His main research interest is understanding how gibberellin signalling is regulated in tomato.

Paul Larsen completed his Ph.D. at Purdue University, and is currently an Associate Professor of Biochemistry at the University of California, Riverside. His research interests focus on two distinct topics using *Arabidopsis* as a model system. He is studying the mechanisms underlying control of the magnitude of the ethylene response. He is also investigating the genotoxic effects of aluminum on plant growth and development, and attempting to elucidate the biochemical mechanisms responsible for detecting this damage, in order to develop a better understanding of how to engineer crops that can grow in aluminum-toxic environments.

Thomas Hartwig is a Postdoctoral Fellow at the Carnegie Institution for Science, Department of Plant Biology at Stanford University in California. He previously received his Ph.D. from Purdue University, U.S.A., and his Masters degree from the University of Rostock, Germany. Hormone networks that control plant development are the central focus of his research. He is particularly interested in the signal cross-talk that regulates branching patterns and sex determination in maize.

Zhi-Yong Wang is a Faculty Staff Member at the Carnegie Institution for Science, Department of Plant Biology at Stanford University in California. He is using genetic, genomic and proteomic approaches to investigate the molecular mechanisms underlying plant growth responses to hormonal and environmental signals. His research focuses on the brassinosteroid signalling pathway and its interconnections with other signalling pathways and developmental programmes. He received his Ph.D. from the University of California, Los Angeles, and his B.S. from Lanzhou University, China.

Selena Gimenez-Ibanez studied Agricultural Engineering at the Polytechnic University of Valencia, Spain, and completed her Masters thesis at Wageningen University, Netherlands. She pursued her Ph.D. studies at the Sainsbury Laboratory, UK, a leading centre in plant-microbial sciences, where she specialized in phytopathology. She then joined Roberto Solano's group in Spain to study hormone-dependent plant immunity. She is currently a UNESCO-L'Oréal International Fellow, and her research focuses on the identification of plant immune components that lead to resistance and how adapted pathogens overcome them. Her ultimate aim is to apply her findings to reduce crop losses to disease.

Dr. Marta Boter graduated in Biology at the University of Barcelona. During her Ph.D. under the supervision of Dr. Salomé Prat at the Centro de Investigación y Desarrollo (CID-CSIC), Barcelona, she specialized in plant responses to abiotic and biotic stresses and hormone signalling, focusing on jasmonate (JA) signalling. She then joined Dr. Ken Shirasu's group at the Sainsbury Laboratory, Norwich, UK, where she was awarded a Marie Curie Intra-European Fellowship to work on effector-triggered immunity (ETI). She subsequently joined Roberto Solano's laboratory at the Centro Nacional de Biotecnología (CNB-CSIC), Madrid, where she has continued her research on plant hormone signalling and disease resistance.

Roberto Solano studied Biology at the University of Alcalá de Henares, Madrid, and completed his Ph.D. in Biology, during which he studied MYB transcription factors, in the laboratory of Javier Paz-Ares at the Centre for Biological Research (CIB-CSIC), Madrid. He then joined Professor Joseph Ecker's group at the University of Pennsylvania, Philadelphia, to work on ethylene signalling. He subsequently joined the National Centre for Biotechnology

(CNB-CSIC), Madrid, and is currently Full Professor at the Department of Plant Molecular Genetics. His research group focuses on the elucidation of the jasmonoyl-isoleucine (JA-Ile) signalling pathway in model plants, and on the development of biotechnological applications to improve disease resistance and yield in crops.

Karolina Pajeroska-Mukhtar is an Assistant Professor of Biology at the University of Alabama at Birmingham, U.S.A., with 15 years of experience in plant-microbe interactions. She completed her Masters degree in Biology at the University of Szczecin, Poland, and her Ph.D. in Plant Genetics from the Max Planck Institute for Plant Breeding Research in Cologne, Germany. She subsequently completed her postdoctoral training at Duke University, North Carolina, where she studied transcriptional and post-transcriptional regulation of plant immunity as well as pathogen-triggered manipulation of plant hormone signalling. Currently the focus of her laboratory studies is the link between plant defence responses and endoplasmic reticulum stress through a project funded by the prestigious National Science Foundation (NSF)-CAREER award.

Xiaoyu Liu completed her Bachelor's degree at the School of Life Science, Capital Normal University, China. Currently she is a Ph.D. student and research assistant in the Department of Biology, University of Alabama at Birmingham, U.S.A. Her research interest in the plant immune system was initiated during a DAAD (German Academic Exchange Service)-supported internship at the University of Tübingen, Germany, in 2010. Recently, her research conducted during this internship was recognized when she co-authored a research paper published in *PLoS Pathogens*. Her current research is exploring the genetic and molecular mechanisms underlying the involvement of the unfolded protein response (UPR) in plant defence responses.

Kristin Schwarzauer-Rockett is currently a Ph.D. student in the Department of Biology at the University of Alabama in Birmingham, U.S.A. She completed both her Bachelor's degree and her Masters degree at Jacksonville State University in Jacksonville, Alabama. For her Masters degree she studied the interaction of kudzu and heavy metals, and developed an interest in the plant immune system. Her research on the effects of the 2010 BP oil spill on plants increased her interest in plant defence responses. Her current research includes determining the specific roles of UPR genes in pro-survival and pro-death cellular signalling pathways.

Camilla Körner is currently working as a postdoctoral researcher at the University of Alabama in Birmingham, U.S.A. She completed her Bachelor's degree in Agricultural Science at the Royal Veterinary and Agricultural University in Copenhagen, followed by a Masters degree in Biological Science from the University of Amsterdam. Her graduate studies focused on abiotic stress signalling in plants. For her Ph.D. studies at the University of Basel, she moved to the topic of biotic stress signalling in plants, and worked on identifying factors that affect the severity of symptoms caused by viruses.

Ayane Motomitsu began her scientific career in the Faculty of Science at Kumamoto University, Japan. In 2014, before completing her undergraduate programme, she skipped a grade and began an M.Sc. in the Graduate School of Science and Technology, Kumamoto University, Japan. She is studying the molecular basis of the apical meristem in *Arabidopsis thaliana*. Since 2014 she has also worked as a visiting student at Temasek Life Sciences Laboratory (TLL), Singapore.

Shinichiro Sawa graduated from Nagoya University, Japan, and received his Ph.D. from Kyoto University. He identified the abaxial identification gene *FIL*, and is now studying how peptide signalling regulates plant meristem activity. He worked as an Assistant Professor at Tokyo

Metropolitan University and then at the University of Tokyo, as an Associate Professor at the University of Tokyo, and is currently a Professor at Kumamoto University, Japan. Recently his research has focused on the molecular mechanisms of infection by plant parasitic nematodes.

Takashi Ishida graduated from Meiji University, Japan, and received his Ph.D., for which he studied the molecular mechanisms underlying cortical microtubule dynamics in plant cells, from the Nara Institute of Science and Technology (NAIST), Japan. He then worked as a Postdoctoral Fellow at RIKEN, Japan, where he studied the developmental regulation of the phase transition from cell proliferation to cell differentiation. He subsequently moved to the Nara Institute of Science and Technology (NAIST), Japan, and then became an Assistant Professor at Kumamoto University, Japan, where he is studying the intracellular signal transduction mechanisms of peptide hormones in the regulation of stem cells.

Ianis G. Matsoukas is a Lecturer in Synthetic Biology and Research Co-ordinator at the University of Bolton, U.K. He completed his Ph.D. in Molecular Genetics at the University of Warwick, U.K., and his postdoctoral studies at Cornell University and ETH-Zurich focused on *cis*-elements bioinformatics. His academic interests include systems and synthetic biology-based approaches to addressing global challenges related to food security, sustainable energy and health. His current research interests include exploring the genes and mechanisms underlying developmental transitions in plants, and applying *in-silico* and synthetic biology-based approaches to the analysis of *cis*-elements involved in events related to sugar metabolism.

Sonia Gazzarrini obtained a B.Sc., followed by an M.Sc. in Plant Physiology, from the University of Milan, Italy. She then completed a Ph.D. in Plant Molecular Biology at the Eberhard Karls Universität Tübingen, Germany. Subsequently she was a Postdoctoral Fellow in Professor P. McCourt's research group in the Department of Botany at the University of Toronto, and then an Assistant Professor at the University of Toronto. She is currently an Associate Professor in the Department of Biological Sciences and Department of Cell and Systems Biology at the University of Toronto,.

Allen Y-L Tsai completed a B.Sc. in Microbiology and a Ph.D. in Cell and Systems Biology at the University of Toronto. Currently he is a Postdoctoral Fellow at the University of British Columbia in the research groups of Professor G.W. Haughn and B.E. Ellis.

Teva Vernoux is a director of research at the CNRS and a group leader of the Laboratory of Plant Reproduction and Development (RDP) laboratory at the Ecole Normale Supérieure in Lyon, France. His main research interests are hormone signalling systems in plants and their role in the dynamics of the shoot apical meristem in regulating plant architecture, principally by using systems biology approaches. His contributions to these fields include the systematic analysis of auxin signalling components in the shoot apical meristem, the development of novel biosensors to study auxin signalling, and the identification of a novel role for cytokinin inhibitory fields in regulating phyllotactic patterns in plants.

Antoine Larrieu completed his Ph.D. at the University of Nottingham and at the Plant Systems Biology Department in the University of Ghent under the supervision of Professor Malcolm Bennett and Professor Tom Beeckman. During his Ph.D. he used chemical genetics approaches to study auxin signalling and its role in regulating root architecture. He is currently a Postdoctoral Fellow working in the laboratory of Dr. Teva Vernoux. His main research interest is the development of novel fluorescent hormone biosensors to study plant development, with a particular focus on studying the regulation by auxin of organ initiation and positioning at the shoot apical meristem.

ABBREVIATIONS

AA	ascorbic acid
ABA	abscisic acid
ABA-GE	ABA-glucosyl ester
ABC	ATP-binding cassette
ABRE	ABA-responsive element
ACC	1-aminocyclopropane-1-carboxylic acid
ACO	ACC oxidase
ACS	ACC synthase
AHA2	H ⁺ -ATPase 2
AHK	Arabidopsis histidine kinase
AHP	Arabidopsis histidine phosphotransferase
ARF	auxin response factor
ARR	Arabidopsis response regulator
AuxRE	auxin response element
AZ	abscission zone
AZA	azelaic acid
BABA	β-aminobutyric acid
bHLH	basic helix-loop-helix
BiFC	bimolecular fluorescence complementation
BiP2	binding protein 2
BL	brassinolide
bp	base pair
BR	brassinosteroid
bZIP	basic-leucine zipper
CBF	CRT-binding factor
CE	coupling element
CEP	C-terminally encoded peptide
CK	cytokinin
CLE	CLAVATA3/embryo surrounding region
CLV	CLAVATA
CO	CONSTANS
COR	coronatine
COR-MO	coronatine-O-methyloxime
CPPU	<i>N</i> -phenyl- <i>N'</i> -(2-chloro-4-pyridyl)urea
CPS	<i>ent</i> -copalyl diphosphate synthase
CRF	cytokinin response factor
CRSP	CO ₂ response secreted protease
CRT	C-repeat
CRT3	calreticulin 3
CRY	cryptochrome

CTD	C-terminal domain
CTR	constitutive triple response
CYP	cytochrome P450
cZ	<i>cis</i> -zeatin
DA	dehydroabietinal
DBD	DNA-binding domain
DIR1	defective in induced resistance 1
DPA	dihydrophaseic acid
DRE	dehydration-responsive element
DREB	DRE-binding protein
DZ	dihydrozeatin
EPF	epidermal patterning factor
ER	endoplasmic reticulum
ERAD	endoplasmic-reticulum-associated degradation
ERF	ethylene-responsive factor
ERQC	endoplasmic reticulum quality control
ESF	embryo surrounding factor
ET	ethylene
FCA	flowering time control protein A
FD	flowering locus D
FMI	floral meristem identity
FPI	floral pathway integrator
FR	far red
FRET	fluorescence resonance energy transfer
FT	flowering locus T
FTIP1	FT-interacting protein 1
G3P	glycerol-3-phosphate
GA	gibberellin
GC	guard cell
GGDP	<i>trans</i> -geranylgeranyl diphosphate
GID1	gibberellin insensitive dwarf 1
GMC	guard mother cell
GS	glucosinolate
GSK3	glycogen synthase kinase 3
GT	glucosyltransferase
GTF	general transcription factor
GUS	β -glucuronidase
HDA	histone deacetylase
HK	histidine kinase
HPt	histidine phosphotransfer protein
HR	homologous recombination
HSL	hormone-sensitive lipase
IAA	indole-3-acetic acid
IC	isochorismate
ICS	isochorismate synthase

IDA	inflorescence deficient in abscission
IDD	indeterminate domain protein
iP	isopentenyladenine
IP5	inositol pentakisphosphate
IPA	indole-3-pyruvate
IPL	isochorismate pyruvate lyase
IPP	isopentenyl diphosphate
IRE1	inositol-requiring enzyme 1
JA	jasmonic acid; jasmonate
JA-Ile	(+)-7- <i>iso</i> -jasmonoyl-L-isoleucine
JAZ	jasmonate ZIM domain
LD	long day
LDP	long-day plant
LRR	leucine-rich repeat
MAMP	microbe-associated molecular pattern
MAP	mitogen-activated protein
MAPK	mitogen-activated protein kinase
MAPKKK	mitogen-activated protein kinase kinase kinase
MeSA	methyl ester of salicylic acid
miRNA	microRNA
MLPK	M-locus protein kinase
MMC	meristemoid mother cell
MoCo	molybdenum cofactor
NCED	9- <i>cis</i> -epoxycarotenoid dioxygenase
NO	nitric oxide
NPR1	nonexpressor of pathogenesis-related genes 1
NRAMP	natural resistance-associated macrophage protein
NT	N-terminal
2ODD	2-oxoglutarate-dependent dioxygenase
PA	phaseic acid
PAL	phenylalanine ammonia-lyase
PC	phospholipid phosphatidylcholine
PCD	programmed cell death
PEBP	phosphatidylethanolamine-binding protein
PIF	phytochrome-interacting factor
PM	plasma membrane
PP2C	protein phosphatase 2C
PR	pathogenesis-related
PRR	pseudo-response regulator
PSK	phytosulfokine
PSKR	phytosulfokine receptor
PSY	peptide-containing sulfated tyrosine
PTM	post-translational modification
PYR	pyrabactin resistance
QC	quiescent centre

RALF	rapid alkalization factor
RCAR	regulatory component of ABA receptor
RdDM	RNA-directed DNA methylation
RIDD	regulated IRE1-dependent decay
RIDS	regulated IRE1-dependent splicing
RLCK	receptor-like cytoplasmic kinase
RLK	receptor-like kinase
RNAi	RNA interference
RR	response regulator
SA	salicylic acid
SAM	S-adenosylmethionine; shoot apical meristem
SAR	systemic acquired resistance
SCF	Skip–Cullin–F-box
SCR	S-locus cysteine-rich protein
SD	short day
SDP	short-day plant
SDR	short-chain dehydrogenases/reductases
siRNA	small interfering RNA
SL	strigolactone
SLG	S-locus glycoprotein
SLGC	stomatal lineage ground cell
SnRK	SNF1-related protein kinase
SRK	S-locus receptor kinase
SUMO	small ubiquitin-like modifier
TAA	tryptophan aminotransferase
TDIF	tracheary element differentiation inhibitory factor
TDZ	thidiazuron
TF	transcription factor
TMK	transmembrane kinase
TMV	tobacco mosaic virus
TPST	tyrosylprotein sulfotransferase
Tre6P	trehalose-6-phosphate
TSF	twin sister of FT
tZ	<i>trans</i> -zeatin
UDP	uridine diphosphate
UGT	uridine diphosphate glucosyltransferase
UPR	unfolded protein response
UPS	ubiquitin–proteasome system
UV-A	ultraviolet A
UV-B	ultraviolet B
WT	wild type
WUS	WUSCHEL
Y2H	yeast two-hybrid
ZEP	zeaxanthin epoxidase
